Helper packages

The following helper packages are loaded and used:

```
library(dplyr)      # for data manipulation

##
## Attaching package: 'dplyr'
## The following objects are masked from 'package:stats':
##
##   filter, lag
## The following objects are masked from 'package:base':
##
##   intersect, setdiff, setequal, union
library(ggplot2)    # for data visualization

## Warning: package 'ggplot2' was built under R version 4.2.2
library(stringr)    # for string functionality
library(gridExtra)  # for manipulating the grid

##
## Attaching package: 'gridExtra'
## The following object is masked from 'package:dplyr':
##
##   combine
```

Modeling packages

The following modeling packages are loaded and used:

```
library(tidyverse)  # data manipulation

## -- Attaching packages ----- tidyverse 1.3.2 --
## v tibble  3.1.8      v purrr   0.3.5
## v tidyr   1.2.1      v forcats 0.5.2
## v readr   2.1.3
## -- Conflicts ----- tidyverse_conflicts() --
## x gridExtra::combine() masks dplyr::combine()
## x dplyr::filter()      masks stats::filter()
## x dplyr::lag()         masks stats::lag()
library(cluster)    # for general clustering algorithms
library(factoextra) # for visualizing cluster results
```

```
## Warning: package 'factoextra' was built under R version 4.2.2
## Welcome! Want to learn more? See two factoextra-related books at https://goo.gl/ve3WBa
```

Data loading

An “iris” data was used and loaded:

```
data("iris")
```

Removing missing value

To remove any missing value that might be present in the data, type this:

```
df <- na.omit(iris)
```

Scaling/standardizing data

We start by scaling/standardizing the data

```
df <- scale(df[c(1:4)])
head(df)
```

```
##   Sepal.Length Sepal.Width Petal.Length Petal.Width
## 1  -0.8976739   1.01560199   -1.335752   -1.311052
## 2  -1.1392005  -0.13153881   -1.335752   -1.311052
## 3  -1.3807271   0.32731751   -1.392399   -1.311052
## 4  -1.5014904   0.09788935   -1.279104   -1.311052
## 5  -1.0184372   1.24503015   -1.335752   -1.311052
## 6  -0.5353840   1.93331463   -1.165809   -1.048667
```

Start two clusters

start at 2 clusters

```
k2 <- kmeans(df, centers = 2, nstart = 25)
str(k2)
```

```
## List of 9
## $ cluster      : Named int [1:150] 2 2 2 2 2 2 2 2 2 ...
##   .. attr(*, "names")= chr [1:150] "1" "2" "3" "4" ...
## $ centers       : num [1:2, 1:4] 0.506 -1.011 -0.425 0.85 0.65 ...
##   .. attr(*, "dimnames")=List of 2
##     .. ..$ : chr [1:2] "1" "2"
##     .. ..$ : chr [1:4] "Sepal.Length" "Sepal.Width" "Petal.Length" "Petal.Width"
## $ totss        : num 596
## $ withinss     : num [1:2] 173.5 47.4
## $ tot.withinss : num 221
## $ betweenss    : num 375
## $ size         : int [1:2] 100 50
## $ iter         : int 1
## $ ifault       : int 0
## - attr(*, "class")= chr "kmeans"
```

Plotting of 2 clusters

plot the 2 clusters

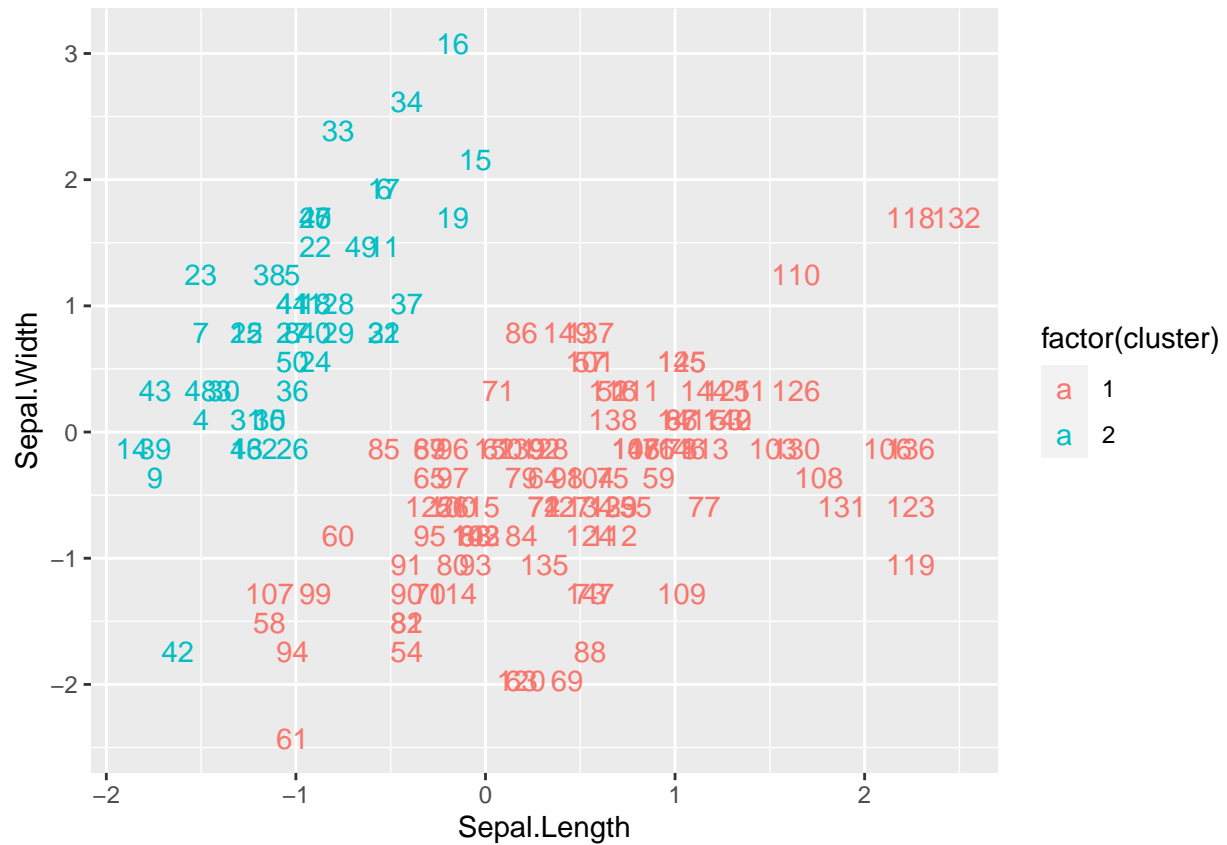

```
fviz_cluster(k2, data = df)
```

Cluster's data

Get the each cluster's data

```
df %>%
  as_tibble() %>%
  mutate(cluster = k2$cluster,
         Species = row.names(iris)) %>%
  ggplot(aes(Sepal.Length, Sepal.Width, color = factor(cluster), label = Species)) +
  geom_text()
```

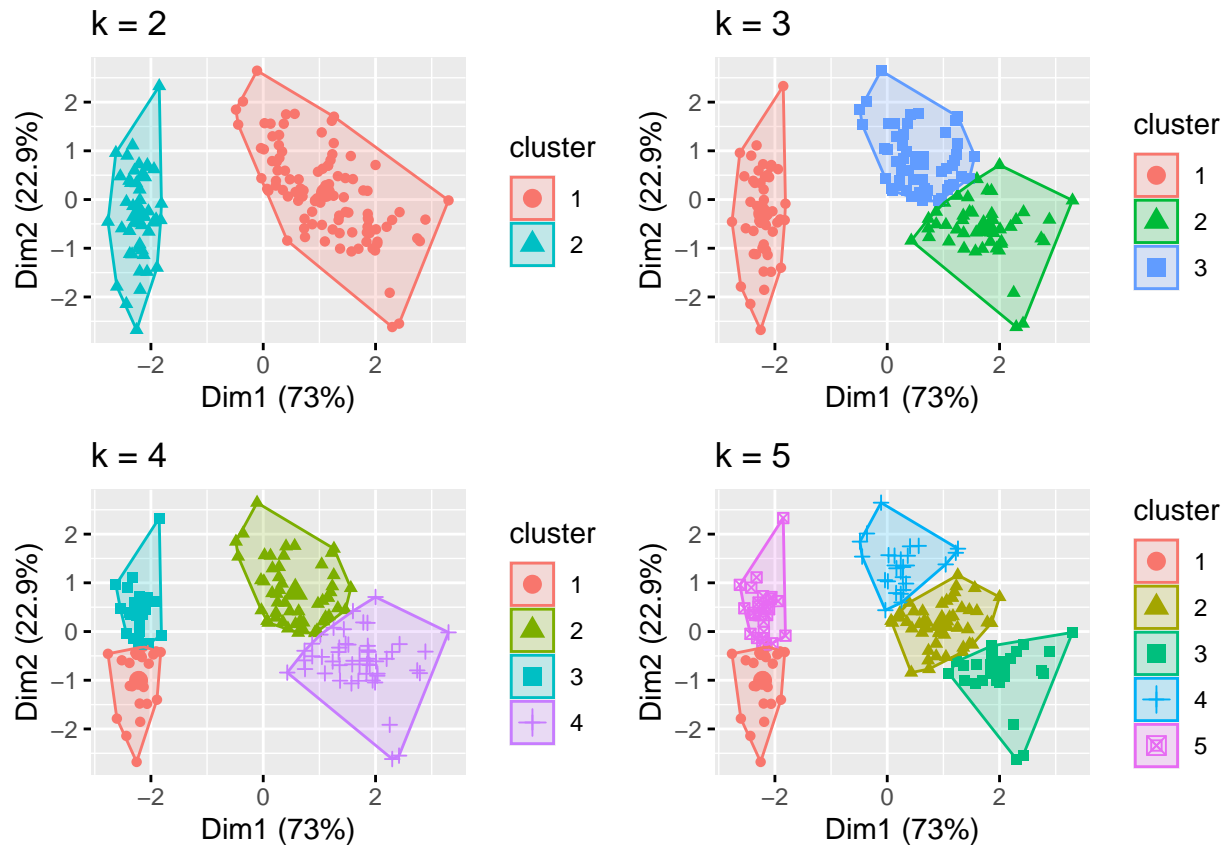

```
k3 <- kmeans(df, centers = 3, nstart = 25)
k4 <- kmeans(df, centers = 4, nstart = 25)
k5 <- kmeans(df, centers = 5, nstart = 25)
```

Plots to compare

Plots are compared:

```
p1 <- fviz_cluster(k2, geom = "point", data = df) + ggtitle("k = 2")
p2 <- fviz_cluster(k3, geom = "point", data = df) + ggtitle("k = 3")
p3 <- fviz_cluster(k4, geom = "point", data = df) + ggtitle("k = 4")
p4 <- fviz_cluster(k5, geom = "point", data = df) + ggtitle("k = 5")

grid.arrange(p1, p2, p3, p4, nrow = 2)
```

Determining Optimal Number of Clusters

We determine the optimal number of clusters:

```
set.seed(123)
```

Function to compute total within-cluster sum of square

Function was created to compute the total within-cluster sum of squares

```
wss <- function(k) {
  kmeans(df, k, nstart = 10)$tot.withinss
}
```

Compute and plot wss for k = 1 to k = 15

We compute and plot wss for $k = 1, 2, 3, \dots, 15$

```
k.values <- 1:15
```

Extract wss for 2-15 clusters

We extract wss for 2 - 15 clusters

```
wss_values <- map_dbl(k.values, wss)

plot(k.values, wss_values,
     type="b", pch = 19, frame = FALSE,
```

```
xlab="Number of clusters K",  
ylab="Total within-clusters sum of squares")
```

or use this

Or you can use other method

```
fviz_nbclust(df, kmeans, method = "silhouette")
```

compute gap statistic

We have to compute the *gap statistic*

```
set.seed(123)
gap_stat <- clusGap(df, FUN = kmeans, nstart = 25,
                   K.max = 10, B = 50)
```

Print the result

We print the results

```
print(gap_stat, method = "firstmax")
```

```
## Clustering Gap statistic ["clusGap"] from call:
## clusGap(x = df, FUNcluster = kmeans, K.max = 10, B = 50, nstart = 25)
## B=50 simulated reference sets, k = 1..10; spaceH0="scaledPCA"
## --> Number of clusters (method 'firstmax'): 3
##      logW      E.logW      gap      SE.sim
## [1,] 4.534565 4.755428 0.2208634 0.02534324
## [2,] 4.021316 4.490212 0.4688953 0.02670070
## [3,] 3.806577 4.293793 0.4872159 0.02124741

## [10,] 3.278659 3.759003 0.4803440 0.01576050
```

```
fviz_gap_stat(gap_stat)
```

Compute k-means clustering with $k = 2$

compute the k-means clustering with $k = 2$

```
set.seed(123)
final <- kmeans(df, 2, nstart = 25)
print(final)
```

```
## K-means clustering with 2 clusters of sizes 50, 100
```

```
##
```

```
## Cluster means:
```

```
##   Sepal.Length Sepal.Width Petal.Length Petal.Width
